

## Supplemental Figure 9

**SI figure 9:** NCI-H1975 parental and CO-1686 resistant clones cluster into distinct groups using the Byers et al. (2013) EMT signature (76 genes; 96 probes). Each parental and resistant clone has duplicate samples (labeled A and B). Average-linkage hierarchical clustering was performed using Euclidean distance of standardized gene expression levels (mean of zero and standard deviation of one). Gene symbols of significantly differentially expressed genes of interest are highlighted.
