

Supplementary Figure S3

Supplementary Figure S3. CD16 expression on total NK cells was reduced in patients with different types of malignant cancers. Expression (Mean Fluorescence Intensity, MFI) of CD16 (upper plot) and CD226 (lower plot) on total NK cells in healthy controls (grey) and patients (black) with benign (n=14) and malignant ovarian carcinoma, melanoma, bladder cancer, and other solid cancers (n=15). Expression of CD16 and CD226 is also shown in alive and dead cancer patients with the AA- and Bx-telomeric genotypes. *, p<0.05, and **, p<0.01 in ANOVA and DSM post-hoc tests.
