

Supplementary Figure S2. Repeated BoHV-4-based vaccination do not induce virus neutralizing antibodies. Representative FACS **(A)** or fluorescent microscope **(B)** analysis of control HEK-293T cells and HEK-293T cells infected with a GFP-expressing BoHV-4 (BoHV-4-GFP) pre-incubated or not with different dilutions (1:5; 1:10; 1:20) of sera from BALB-neuT mice left untreated or vaccinated 6 times with BoHV-4-based vectors. **(A)** Representative histograms are shown, and % of GFP⁺ cells and MFI are reported in the table. **(B)** Representative phase contrast and fluorescence microscopy images. Magnification 20X.
