

Supplemental Figure 2: Expression of DAL-1, but not DAL-1 ΔU2, suppresses proliferation in IOMM-Lee meningioma cells. 10⁵ cells of each cell line were plated in six wells of a 24-well plate. After 24 hr, the media was changed to serum-free DMEM and incubated at 37°C for 24 hr, then replaced with serum-free DMEM containing 1mCi/ml ³H-thymidine (Amersham) for 4 h. Cells were washed twice in PBS and solubilized in 200 mM NaOH. Counts per minute (d.p.m.) were determined in a Liquid Scintillation Beta Analyzer (Packard Instruments Co., Meridian, CT, USA), and mean and standard deviation were determined for each line. This experiment was repeated at least three times with similar results. Asterisk * denotes $P < 0.001$ using the Student's *t*-test.
