

Supplementary Fig. 2

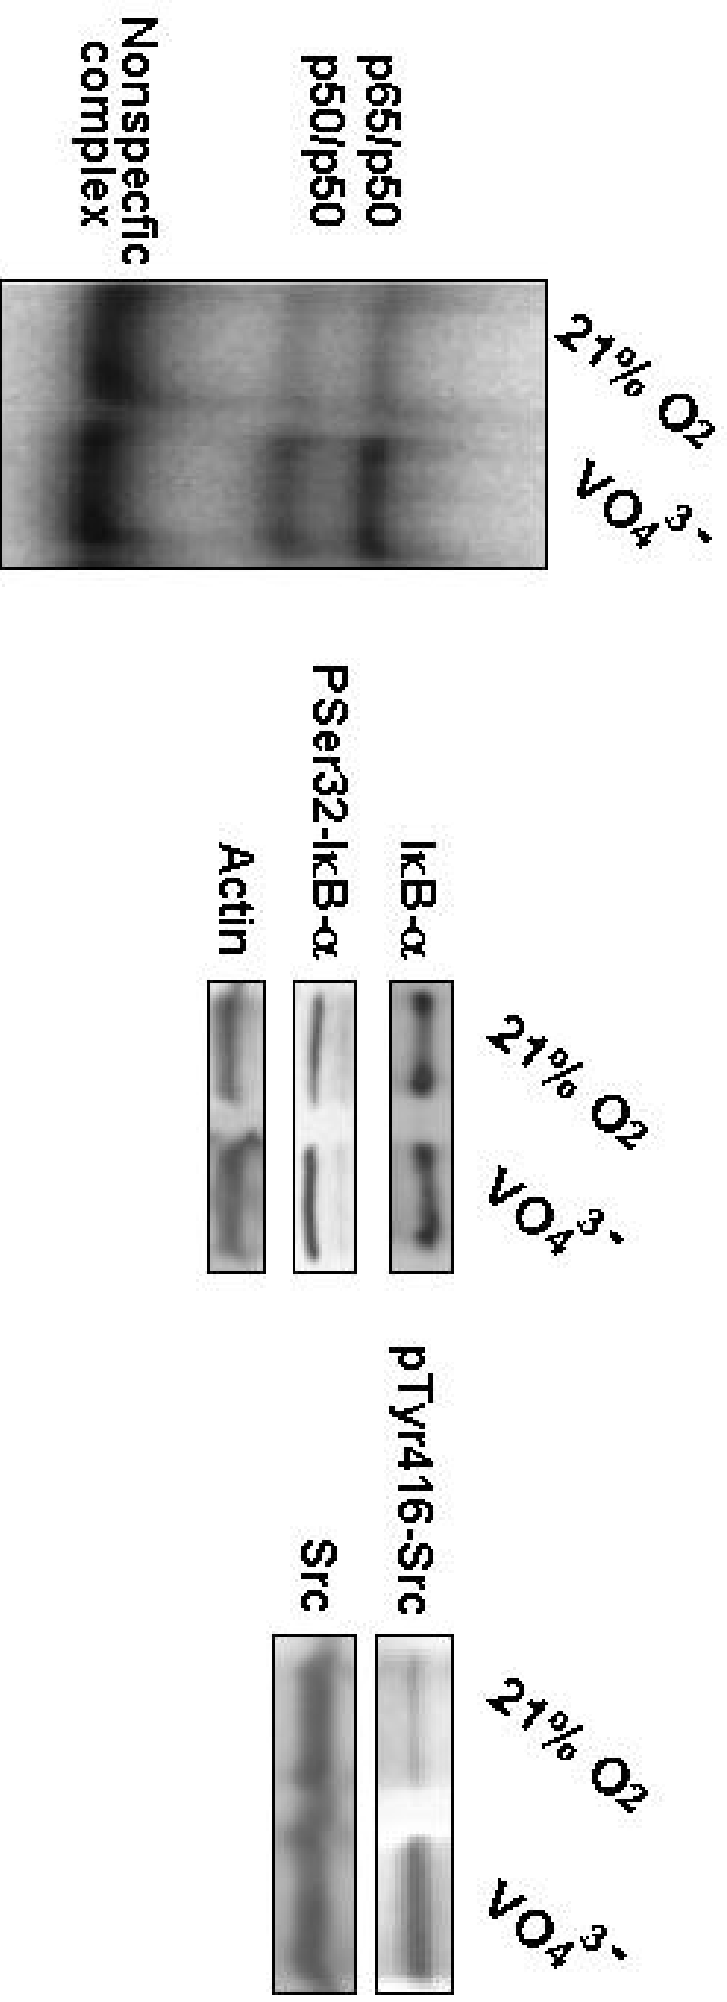

Figure 2. **Pervanadate activates NF-κB and Src in HepG2 cells.** HepG2 cells were exposed to pervanadate and the activation of NF-κB was examined by EMSA. In some cases, cell extracts were prepared to determine the levels of phosphoSer32 IκB-α and the phosphoTyr416 Src by specific antibodies. Representative blots out of 3-4 individual experiments with similar results are shown.
