

Supplementary Figure 1. A, Protection from tumor re-challenge in animals immunized with neo-adjuvant AdhDCT. Tumor-bearing mice were vaccinated with 10^8 pfu of AdhDCT 9 days prior to surgery, underwent surgical dissection of the tumor and subsequently re-challenged with 1×10^5 B16F10 three months post surgery (■). A control group of mice was injected with 1×10^5 B16F10 at the time of re-challenged monitored for tumor growth (●). **B,** Efficacy of neo-adjuvant immunization depends on the choice of antigen. Tumor-bearing mice were

vaccinated with 10^8 pfu of Adhgp100 9 days prior to surgery of left
unvaccinated (●). Pooled data from 2 independent experiments are shown.
