

## Boni et al, supplementary figure 2

**Supplementary figure 2. MHC class I expression levels after treatment with MEK or B-raf inhibitors.** Melanoma cell lines were treated for 72 hours with PD0325901 (0.1  $\mu$ M) or with PLX 4720 (1  $\mu$ M) or left untreated as a control. Expression of MHC class I was assessed by flow cytometry using an anti-beta-2-microglobulin antibody. No difference was observed between the different groups in regard to MHC class I expression.
