Supplementary Figure 3

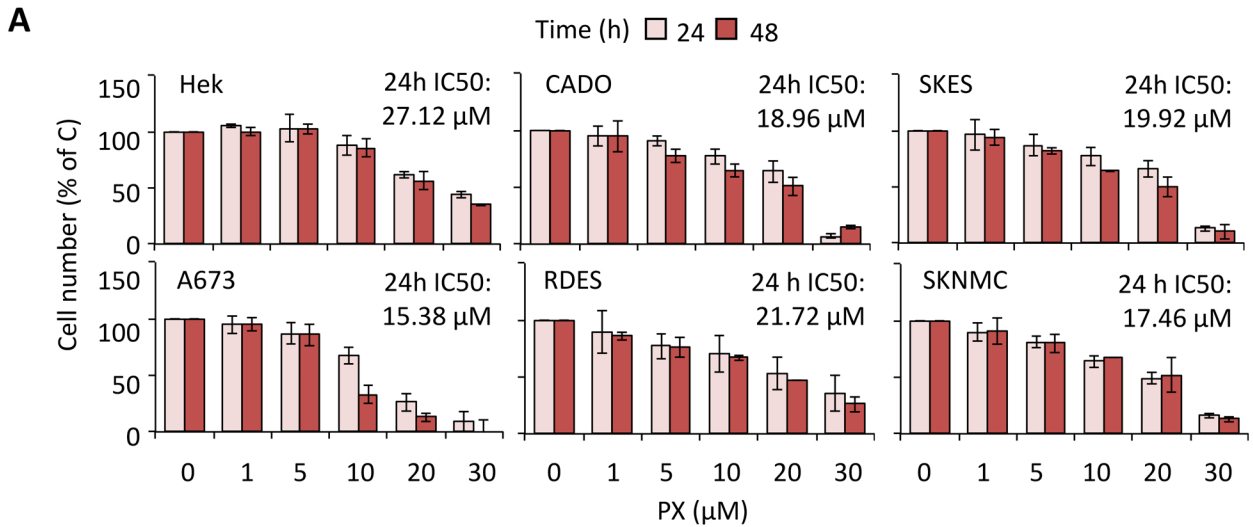

Figure Legend:
(A) Effect of paroxetine on cell survival. Indicated cells were treated with increasing doses of paroxetine (PX) in serum-supplemented media for 24 or 48 h. Cell viability was analyzed using PrestoBlue, and is expressed as percentage of solvent only (DMSO) treated controls. The half maximum inhibitory concentration (IC50, the dose required to kill 50 % of cells compared to solvent-only treated controls) at 24 h was calculated from trend line equations.
