

**Supplemental Figure 8. The comparison of the relative expression of CD24 across paired neuroblastoma cells and tumors in Kaplan-Meier survival study.** Relative expression for CD24 was assessed using qRT-PCR comparing *in vitro* cells prior to injection to *in vivo* samples (averaged from tumors resected from murine hosts post-survival) for each neuroblastoma. Expression was normalized to GAPDH. All qPCR data shown are the composite of triplicate wells acquired from triplicate experiments. Error bars represent standard deviation. \* $p > 0.05$  from SK-N-AS Cells, unpaired t-test.
