

Supplementary Figure S1

Supplementary Figure 1:

Temsirolimus significantly reduces meningioma tumor growth in vivo. Nude mice were intraperitoneally treated with temsirolimus as described in methods or left untreated following subcutaneous implantation of 3×10^6 IOMM-Lee meningioma cells. The tumors of treated animals exhibited a lower size (**left figure**) and the mean weight of tumors measured after killing of mice was significantly reduced in treated animals, as determined by U-test (**right figure**).
