

**Supplemental Figure 2. Pair-wise HRD score difference across patients.** A) The pair-wise HRD score differences were shown across 23 patients ordered by their subtype. As control, we computed the pair-wise HRD score difference between any two samples from different patients. The median level of the control is shown as a dash line. B) The pair-wise HRD score differences were shown across 14 patients with low HRD score ordered by their subtype. As control, we computed the pair-wise HRD score difference between any two samples with low HRD scores from different patients. The median level of the control is shown as a dash line. C) The pair-wise HRD score differences were shown across 9 patients with high HRD score ordered by their subtype. As control, we computed the pair-wise HRD score difference between any two samples with high HRD scores from different patients. The median level of the control is shown as a dash line.
