

Supplemental Figure 2. Individual absolute tumor volumes per experiment and per treatment group on the first and last day of experiment. Tumors from mice that were sacrificed or found dead before the final day of the experiment were excluded from the tumor volume graph and statistical analysis. Statistical significance was calculated using the Wilcoxon Matched Pairs-test with $p < 0.05$ considered as statistically significant which defines tumor shrinkage or tumor growth. In case of no statistically significant difference (ns), the tumor volumes were considered as stable.

Single tumor trend
