

Figure S6

Viability of PSMA⁺ HUVEC as a function of delivered radioactivity per cell mediated by the Ab-targeted radiolabeled vesicles (white), the urea-targeted radiolabeled vesicles (gray), and the radiolabeled antibody (black), in (A) in static incubation conditions, and (B) in the presence of a flow field. Viability evaluated after one doubling time. Error bars correspond to standard deviations of repeated measurements (2 and 3 independent preparations for antibodies and vesicles, respectively, 2 measurements per preparation).
