

Supplementary Figure S6. Knockdown of ALK^{ATL} with siRNA does not affect cell viability. **A**, MB 1692 cells were transfected with siRNAs (NTC, non-targeting control). Lysates were collected 72 hours post-transfection and analyzed by immunoblotting. **B**, Immunoblots were quantified to determine ALK^{ATL} expression using ImageJ software. ALK^{ATL} expression was normalized to β -actin and is shown relative to NTC. **C**, Cells were plated 24 hours post-transfection into duplicate 96-well plates. Viability was analyzed after 48 and 72 hours and normalized to NTC. Error bars represent SEM of three technical triplicates.
