

Supplementary Fig. S1 Study Design.

Each cycle of treatment was defined as an interval of 21 days. Patients who discontinued study treatment, or had completed 6 cycles of combination therapy, and did not progress and did not initiate a new systemic treatment for their disease were assessed for progression by imaging studies every 6 weeks (± 7 days) until PD. Patients who had had surgical resection were not followed for subsequent progression by imaging studies.

Abbreviations: C, cycle; D, day; WBS, whole blood sample.
